----------------	-----------------	--

1. Abstract

(Summarize the project idea, problem background, and proposed solution. Not more than 250 words.)

The AI-Based Personal Health Assistant is a smart healthcare support system designed to help users manage their personal health information in one centralized platform. Users can maintain records of symptoms, medications, appointments, daily health activities, and other relevant health information. The system aims to solve the problem of scattered or poorly maintained health records by providing an organized and user-friendly platform for storing and accessing personal health data.

The proposed system integrates an AI component to analyze user-provided symptoms and health information and provide general health insights and recommendations. A structured database will store user profiles, health records, medications, symptoms, reminders, and interaction history, while a distributed backend will manage authentication, data processing, API requests, and communication between different system components. The project demonstrates the practical application of database management, backend development, REST APIs, and AI integration in developing a personalized health management system.

2. Team Details

Roll Number(s)	Name of the Student	Signature
2520030020	Varnika Vadapalli	
2520030352	Minajja Reddy	

3. Frameworks / Platforms / Software Used

(List the frameworks, libraries, platforms, or tools you plan to use.)

- ☐ **Frontend:** HTML, CSS, JavaScript / React.js
- ☐ **Backend:** Node.js, Express.js
- ☐ **Database:** MongoDB
- ☐ **Database Management:** MongoDB Atlas / MongoDB Compass
- ☐ **Authentication:** JWT (JSON Web Token)
- ☐ **Development Environment:** Visual Studio Code
- ☐ **Version Control:** Git and GitHub
